

Lab Calendar with File

The point of this lab is to practice reading a file. It can also give some practice in program organization.

Use your Calendar mock up or the one I'm attaching here. Add a button that opens a file and reads calendar data out of it and add that to what you see. An easy file format is just the day number (then a space) and the rest is the text for that event:

6 Here's an event for day 6 on the calendar

19 Moe's birthday

24 whatever!

You can hardwire the filename, and then see if you can do a dialog box to let the user pick it.

Submit as CalFileYourname.java in package lab04.
